

COIL-CAGE BURNERS

MODEL: A-E SERIES

Revision: 0

BULLETIN
3230

DESCRIPTION

Coil-Cage Burners are complete assemblies for gas firing immersed tubes for heating water, solutions, oils, and other liquids. These assemblies are engineered to allow ample secondary air for good combustion at all times.

Burner selection data and coil size selection tables for any tank to be heated are included on pages 2 to 5. Atmospheric Burner assemblies are listed in capacity table below.

The burner nozzle is centered by set screws and lugs and a pilot bracket may be added even after installation is made.

For pilot assemblies that can be added to any Coil-Cage Burner see Bulletin 3271.

Maximum Burner Input, Coil Length &
BTU/SQ. FT. for Various Pipe Coil Sizes*

Pipe Coil Size	Atmospheric Burners		
	Max. Burner Input BTU/hr	Max. Coil Length in Ft.	Max. Input in BTU/ft of Coil Length
2-1/2"	41,500	8.5	4,900
3"	71,000	12	5,900
4"	120,000	16	7,450
5"	165,000	18	9,150
6"	207,000	20	10,350
8"	310,000	25	12,400

* Based on 250°-300°F differential temperature between flue gas & liquid using 4' stack height.

COIL-CAGE BURNERS

BULLETIN 3230
PAGE NO. 2

GENERAL INFORMATION

The design and selection data contained in the following tables have been employed in applying immersion coil heating equipment to numerous solution and oil heating tanks. If these specifications are followed, satisfactory operation of the heating equipment can be assured.

A reasonably accurate calculation of the net heat required by the immersion heated installation is necessary for the satisfactory application of these tables. This calculation is based on knowing a few basic and readily available facts about the operation. These include the tank, its size, material and whether or not it is insulated, plus the operating temperature and specific heat of the liquid to be heated. These data are used to figure the total evaporation and radiation heat losses, as well as part of the operating heat requirement. Other information, such as the weight of the work per hour, the time allowed to bring the liquid to temperature, the type burner equipment to be used, and the desired flue gas temperature should be available before starting the calculation.

HEATING CALCULATIONS

Figure 2 illustrates in detail the steps involved in calculating the various heat losses and requirements, as well as the selection of the proper coil size and burner capacity. It is first necessary to obtain data on the seven items listed in the table. This information can then be used to figure all heat requirements.

The heating up calculations may be divided into four steps, as shown in example :

1. Heat for raising the liquid from its original temperature up to operating temperature in the time selected. In this case the specific heat of water (1.0) is not indicated in the calculation. If other materials are used, this figure may be obtained from standard tables.
2. Radiation and evaporation losses from the exposed surface of the liquid can be easily figured by referring to Figure 1.
3. Radiation losses from tank wall can also be found in Figure 1.
4. Heating the tank material to operating temperature is calculated by using the specific heat of steel (0.2) multiplied by the weight and the temperature rise.

The operating heat requirements may be obtained by using the liquid radiation and evaporation necessary for the hourly work load. In the example, both the total heating up requirements have been figured and the largest picked for use in selecting the coil and burner. It is recommended that this double procedure be followed as under conditions of heavy production the operating requirements may be in excess of the heating up figure. Normally, unless an extended heat up figure can be used.

The next step is to refer the total net heat requirement figure, in this case 119,325 BTU per hour, to the proper table. (see page 5 & 6).

If the coil length selected cannot be arranged to fit the tank, a compromise choice will have to be made. The data can be interpolated to make this selection.

It is possible to obtain higher combustion efficiencies or rather lower flue losses by reducing the gas input per unit of coil length. In general it is not desirable to go to heat transfer rates lower than those shown in the tables because of the excess coil areas and lengths required and the possibilities of trouble from moisture and condensation in stacks.

FIGURE 2
EXAMPLE : SELECTION OF IMMERSION COIL AND BURNER

1. Tank - 18" steel, not insulated - 3' x 3' x 8'
2. Liquid - Water base Solution - 24" deep
3. Temperature - 140 degrees F (from 50° F)
4. Load - Steel, 1200 lbs. per hour
5. Allowable heating up time - 3.5 hours
6. Type of Burner - Atmospheric
7. Selected Flue Gas Temperature - 300°-400° F
8. Type of Gas - Natural

CAUTION: Operation of combustion equipment can be hazardous resulting in bodily injury or equipment damage. Each burner should be supervised by a combustion safeguard and only qualified personnel should install, make system adjustments and perform any required service.

COIL-CAGE BURNERS

BULLETIN 3230
PAGE NO. 4

CALCULATION OF HEAT REQUIREMENTS

HEATING UP

1. Liquid Heating = 48 cu.ft. x 62.5 = 3000 lbs.

$$\frac{3000 \times (140^{\circ} - 50^{\circ} \text{ F})}{3.5 \text{ hours}} = 77,145 \text{ BTU/hr.}$$
 2. Liquid Radiation and Evaporation Loss (From Figure 1)
 24 sq. ft. x 820 BTU/sq. ft. = 19,680 BTU/hr.
 3. Tank Radiation Loss (From Figure 1)
 90 sq. ft. x 160 BTU/sq. ft. = 14,400 BTU/hr.
 4. Steel Tank - 90 sq. ft. x 5# x 0.2 x 90° = 8,100 BTU/hr.
- TOTAL 119,325 BTU/hr

OPERATING

1. Liquid - radiation and Evaporation Loss - 19,680 BTU/hr.
 2. Tank Radiation Loss - 14,400 BTU/hr.
 3. Load - 1200 lbs. x 0.2 (sp.ht.) x 90 = 21,600 BTU/hr.
- TOTAL 55,680 BTU/hr.

COIL AND BURNER SELECTION

- Hourly net heat requirement = 119,325 BTU
 Use "heating up" or "operating requirement" - which ever is greatest
 From Figure 3 (100 - 200 liquid Temp. - Atmospheric Burner)
1. Coil Size - (1) 6" dia. x 17-1/2' long
 Where net heat requirement fall between figures on table, use next larger size.
 2. Burner Capacity Required - 145,000 BTU/hr.
